
The feasibility report's claim

With no anchor in frame (no sacrum, no ribs, no C2), the boxes of a five-lumbar spine look like the boxes of a six-lumbar spine with its top body cropped off:

$$P(B \mid M_5) \approx P(B \setminus b_1 \mid M_6)$$

so absolute level assignment is 'mathematically underdetermined' and a system 'should formally refuse to assign absolute anatomical labels'.

What this establishes: no DETERMINISTIC inverse.
What it does not: that no INFORMATION exists.
A posterior is not bound by the first claim.
Whether it is bound by the second is measured in Fig. 2.
