HOW A MEDICAL STUDENT'S EDIT BECOMES PUBLISHED ANATOMY

1 Meet when you can, not on a schedule

16 contributors · 10 sub-projects · senior-trainee mentorship · no lab bench

2 Two free tools, and you go back and forth

nothing to install · nothing to license · runs on a laptop

3 The server checks every save

```
case 0231  ·  rib review
✗  right rib 12 not incident on T12 (gap 16 mm)
   → check the rib number
✗  one rib bone carries multiple labels: rib_left_8, rib_left_9
✗  left rib 8: in 2 pieces (13 mm apart)
   → CONNECT the pieces

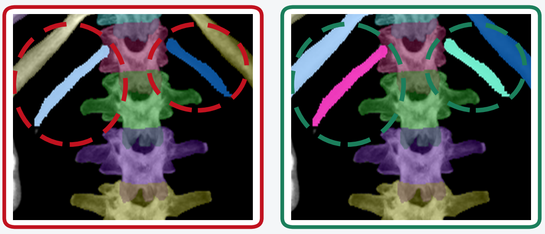

case 0068  ·  spine review
✗  L1 covers TWO vertebral bodies (possible L6)
   → do not guess a shift — flag it
✗  L3 is split into pieces (largest 80% of the bone)
   → one bone must be ONE class
✗  L3 (id 22) is split into 2 pieces (19% in a stray blob)
   → relabel the stray voxels

SUBMISSION REJECTED
```

gated server-side — an edit that still violates anatomy cannot enter the dataset

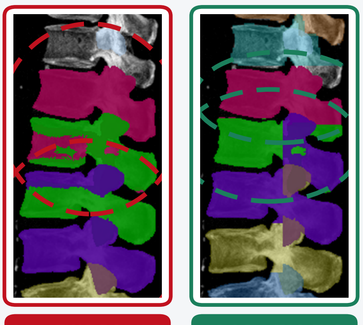

4 The corrections turn out to be the findings

RIBS · case 0231

WRONG: “rib 12” | RIGHT: lumbar rib

VERTEBRAE · case 0068

L1 = TWO BODIES | L1–L6 + T10–T12

`rib_left_12 → rib_left_lumbar`

`L1 split into L1 + L2, column renumbered L1–L6`

Both are the same problem — which level is this? — and both corrections are now labelled classes in CTSpinoPelvic1K v6 (802 CTs, openly licensed).
